TITLE:

Measurement of Multiple Scattering on the Tracks of
 ~ 10 GeV Protons /9

PERIODICAL: Pribory i tekhnika eksperimenta, 1960, No.5, pp.15-19

A large number of papers have been published on the multiple scattering of charged particles in nuclear emulsions (Refs.1-10 and others) in which it is concluded that micro-distortions of the emulsion give rise to spurious scattering. These local distortions are a serious problem in high-accuracy work. Other sources of spurious scattering, such as stage noise, thermal noise etc. can now be adequately allowed for so that the local distortion is a residual effect still to be overcome. The present authors have measured the multiple scattering in НИКФИ -Р (NIKFI-R) 27 emulsions 450μ thick using the МБИ-8 m (MBI-8 m)²⁸ microscope. The 10 GeV synchrophasotron of the Joint Institute for Nuclear Studies was used as the source of the protons. The total length of tracks examined was 2.8 m and the mean length per track was 5 cm. The

Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons

following methods were used to analyse the data obtained. The second difference \bar{D} can be written down in the form

$$\bar{D}^2 = \bar{D}_k^2 + n^2 \quad (1)$$

where \bar{D}_k is the contribution due to Coulomb scattering and is equal to $1.74 Kt^{3/2}/PV$, where P is the momentum, V is the velocity, K is the scattering constant and n is the contribution due to spurious scattering. When $\bar{D}_k \leq 4n$, the quantity n can be excluded by various methods, for example, by taking higher differences (Ref.10). The spurious scattering n can be looked upon as consisting of two parts, one of which depends on the cell size and the other does not. The latter can always be subtracted from the measured \bar{D} in which case Eq.(1) can be re-written in the form

$$\bar{D}^2 = (1.74 K/PV)^2 t^3 + a^2 t^{2x} \quad (2)$$

Card 2/8

85334
S/120/60/000/005/002/051
E032/E514

Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons

On the other hand, the method of three multiple cells described by Chasnikov et al. (Ref.8) gives

$$\bar{D}_K = \left(\frac{\bar{D}_1^2 \bar{D}_4^2 - \bar{D}_2^4}{64\bar{D}_1^2 + \bar{D}_4^2 - 16\bar{D}_2^2} \right)^{1/2} \quad (3)$$

where \bar{D}_1 , \bar{D}_2 and \bar{D}_4 are the mean second differences for cells in the ratio 1:2:4. If one takes into account the fact that the scattering constant K depends on the cell size, the numbers 64 and 16 in Eq.(3) should be replaced by 68 and 16.48. The spurious scattering n can be independently determined and excluded by using higher differences, for example, third, fourth etc. differences. The higher differences also exclude systematic distortions. Chasnikov (Ref.10) has also shown that the dependence of the higher

Card 3/8

Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons

differences on \bar{D}_K and n is

$$n = 0.5222(2\bar{D}^{III^2} - 3\bar{D}^2)^{1/2}, \quad (5)$$

$$n = 0.2(9\bar{D}^{IV^2} - 24\bar{D}^{III^2})^{1/2}, \quad (6)$$

$$\bar{D}_K = 0.4264(10\bar{D}^2 - 3\bar{D}^{III^2})^{1/2}, \quad (5')$$

$$\bar{D}_K = (2.8\bar{D}^{III^2} - 0.8\bar{D}^{IV^2})^{1/2} \quad (6')$$

\bar{D}_K can be found from Eqs.(5') or (6') only in the case of good statistics, since small statistical fluctuations in \bar{D}^{III} or \bar{D}^{IV} have a strong effect on \bar{D}_K . As the order of the difference increases, the contribution due to spurious scattering to this difference for a given cell will also increase. It is, therefore, desirable to determine this spurious scattering with the aid of the

Card 4/8

E032/E514

Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons

higher order differences. The spurious scattering cannot be determined when the statistical error $\Delta D_{st} \approx n$. When $\Delta D_{st} > n > D_K$ the energy cannot be determined at all. The best results for the energy when $\Delta D_{st} \approx n$ are obtained when the scattering is measured using the optimum cell size t_{opt} . Chasnikov (Ref.10) has described a method for determining t_{opt} from the experimentally determined t_{min} for which \bar{D}/t is a minimum. The quantity t_{opt} depends on the length of the track R and t_{min} in the following way:

$$t_{opt} \sim R^{\frac{1}{2(2-X)}} t_{min}^{\frac{3-2X}{2(2-X)}}$$

where t_{opt} , t_{min} and R are in units of 100μ . According to the measurements carried out by the present authors and also other data $X < 1$. When $X = 0.5$, $t_{opt} = cR^{1/3}t_{min}^{2/3}$. With this value of X

Card 5/8

85334

S/120/60/000/005/002/051
E032/E514Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons $t_m = t_o$, where t_o is the cell size corresponding to $D_K = n$.It should be noted that t_{min} is not always equal to t_o , since the spurious scattering index X may not be the same for different emulsions. In finding t_o it is convenient to use the ratios $\rho = \bar{D}^{III}/\bar{D}$ and $q = \bar{D}^{IV}/\bar{D}$. When $\bar{D}_K = n$, $\rho = 1.55$ and $q = 2.8$.However, in the presence of systematic distortions of tracks it is better to use the ratio $\bar{D}^{IV}/\bar{D}^{III}$ or the equivalent ratio q/ρ , which is less dependent on systematic errors. The following table gives the mean values of the second differences for different cells and also the values of ρ and q obtained in the present work.

t, mm	\bar{D}, μ	Number of second differences/ degree of overlapping	ρ	q
0.5	0.221	4966/1	1.75	3.23
1	0.333	4832/2	1.66	3.10
2	0.600	4592/4	1.44	2.58

S/120/60/000/005/002/051
E032/E514Measurement of Multiple Scattering on the Tracks of ~ 10 GeV Protons

The following table gives the values of PV determined by different methods (in GeV)

t, mm	2	3	4	5	6
0.5	2.5	1.8	1.6	11.9 ± 2.4	-
1	4.7	3.5	3	9.36 ± 0.67	9.8 ± 2.0
2	7.7	6.5	6	8.98 ± 0.90	10.7 ± 1.0
4	8.8	9.1	8.7	-	9.82 ± 0.63
8	8.6	9.3	9.1	-	9.96 ± 1.5

The first, third and fourth columns give the values of PV without allowing for spurious scattering and based on second, third and fourth differences, respectively, with \bar{D}_K assumed equal to

\bar{D} , \bar{D}^{III}/ρ_K , \bar{D}^{IV}/q_K . Columns 5 and 6 give the values obtained by Card 7/8

Measurement of Multiple Scattering on the Tracks of ~ 10 GeV
Protons

the multiple cell method and with the aid of Eq.(6'). It was found that in the emulsion used by the present authors the spurious scattering n follows the power law $n = 0.08 t^{0.6}$. It is thus found that provided the spurious scattering is allowed for, the energy of charged particles can be determined by the multiple scattering method in the region of 10 GeV. At this energy the spurious scattering is negligible for a cell size of $t = 4$ mm. Acknowledgments are made to V. I. Veksler and M.I. Podgoretskiy for supplying the nuclear emulsions irradiated with protons obtained from the above machine. There are 2 figures, 4 tables and 11 references: 3 Soviet, 1 German and 7 English.

PERIODICAL: Referativnyy zhurnal, Elektronika i yeye primeneniye, no. 1, 1963, 18, abstract IV 131 (Uzb. biol. zh., no. 2, 1962, 25-29 (summary in Uzb.))

TEXT: The authors have studied the effect of ultrasonic waves on the seeds of the Kokcha type of melon. The melon seeds were first steeped in water for 24 hours at room temperature. The ultrasonic treatment of the seeds was carried out at frequencies of 1 Mc/s, 1.25 Mc/s and 23 kc/s with exposures of 1, 3, 6, 9 and 12 minutes. The experimental results showed for example, that ultrasonic treatment of the seeds at 1 Mc/s for an exposure of 3 - 4 minutes stimulates the growth and development of the plants, and in individual cases raises the productivity by 20-40%. TOPIC TAGS: ultrasonic irradiation, Kapron cafrene

ABSTRACT: The paper gives a brief description of the method and results of the use of an ultrasonic device for stabilizing the dimensions of bushings of K-21/Kapron by treatment in an ultrasonic field in a machine-oil medium. The thermal treatment of the bushings was carried out at vibration frequencies of 23.5 Kc, a temperature of $130 \pm 5^\circ\text{C}$, and exposures of 5, 15, and 25 min. The experiments showed that thermal treatment in an ultrasonic field sharply reduces the duration of the heating, which amounts to 5-25 min instead of the 2-4 hr required in the absence of ultrasound. An increase in the stability of the dimensions of the bushings as compared to ordinary methods of treatment, and also an improvement in the plasticity and strength of the parts were observed. However, the studies showed an inadequate stability in many cases. N. Solov'yev. [Translation of abstract]

Abstract : *F₁* hybrids accelerated their development when grafted onto quick-maturing older parental forms. They behaved differently from hybrids grafted onto quick-maturing forms of a similar age or younger (as regards phases of development) or late-maturing forms. The conclusion is that when hybrids are trained on quick-maturing rootstocks, they develop a seed generation with a shorter vegetation period.

TITLE: Advanced Work-planning Methods of Rolling-mill Operation
(Perekovyye metody organizatsii truda na prokatnykh stanakh)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii, 1956, Vol 10,
pp 276-283

ABSTRACT: A description is given of advanced work-planning methods for the operation of a 750 mill at the "Serp i Molot" Plant. The 750 mill in question consisted of 3 operating stands and one geared stand in a single-row arrangement. 800-kg ingots measuring 275x330x1450 mm were rolled into 140,90, and 50 mm squares or into 13-30x250 mm sheet bars, and some were rolled into 70-100 mm square finished stock. Improvements made in the mill are cited. As a result of these new methods and of the improvements made in the different parts of the mill the 1954 output showed an increase of 75 percent over the 1940 output.

Growing, the best mixture proved to be that of winter peas (varieties 1508 and 1528) with winter rye which produces in April 200-300 centners/ha of green roughage. After this mixture, corn is successfully cultivated, producing up to 100 centners/ha of ears in the milky-waxy stage, 300-400 centners/ha of green roughage of corn stalks and leaves or 80-100 centners/ha of kernels in the ears of full ripeness. The stubble-sown corn grown after barley, in addition to the yield of 35-40 centners/ha of barley grain, produces 80-90 centners/ha of corn ears in the milky-waxy stage or 250-300 centners/ha of green

roughage. The addition of Persian clover (*Trifolium resupinatum*) (5 kilograms of the seeds of Persian clover and 5 kilograms of alfalfa) to alfalfa produces an increase of up to 30 centners/ha in the yield of hay when sown for forage - the pure sowing of alfalfa give 70-80 centners/ha of hay, and mixtures with Persian clover - up to 110 centners/ha. The mixture of alfalfa with Persian clover (*Trifolium resupinatum*) does not lodge and is easily harvested. Good results were secured from the sowing of a mixture of alfalfa with Sudan grass (90-100 centners/ha of hay). -- N.I. Grib

AUTHORS: Zagorodnyuk, Ya.F.; Turtsevich, E.S.

TITLE: Profuse Tillering of Winter Wheat (Moshchnoye ku-shcheniye ozimoy pshenitsy)

PERIODICAL: Priroda, 1959, Nr 2, p 111 (USSR)

ABSTRACT: The authors describe the phenomenon of a profuse growing of side-shoots from low-lying buds in young crops of winter wheat observed in autumn 1957 in the Cherkasskaya gosudarstvennaya nauchno-kokhzyayastvennaya opytnaya stantsiya (Cherkasskaya State Agricultural Experimental Station). The authors explain this phenomenon by the especially favorable interplay of cultivation method and weather conditions. The seed had been sown into bare fallow enriched with 25 tons of manure and mineral fertilizer. The sowing day of 5 September 1957 represented the best possible date in this region. The month of September 1957 had a precipitation of 34.4 mm which is nearly twice the

TITLE: Aerodynamic losses due to the pipe branches in the air cooler of the GTU-25-700 gas turbine installation

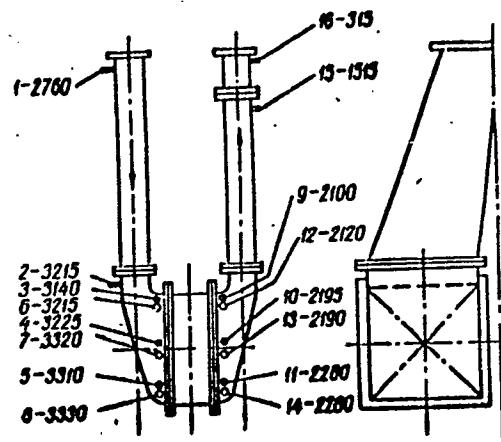

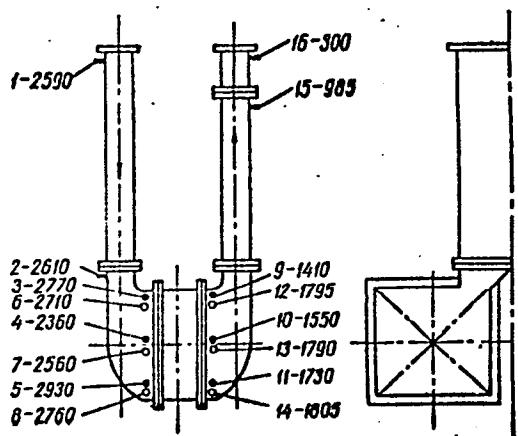

SOURCE: AN UkrSSR. Termodynamika teplovyykh dvigateley (Thermodynamics of heat engines). Kiev, Izd-vo Naukova dumka, 1966, 97-102

TOPIC TAGS: aerodynamic design, gas turbine, turbine compressor

ABSTRACT: Full-scale tests of the GTU-25-700 gas turbine installation in operation at the Kiev Heat and Electric Power Plant No. 2 show that considerable losses of pressure take place in the pipe branches of the air cooler between the high- and low-pressure compressors. It is shown that the aerodynamic losses in these elements may be considerably reduced by changes in design. A model of the existing air cooler is shown in Figure 1 with the improved model shown in Figure 2. The difference between the maximum and minimum static pressures in the second model is less than 200 mm water gauge, while the corresponding figure for the first model reaches 570 mm. While this factor certainly affects the operation of the cooler, the reduction in aerodynamic

Card 1/3

losses alone results in an increase in the power of the installation. Estimates show that the power may be increased by design modifications of this type by approximately 300-400 kw. Orig. art. has: 3 figures, 2 tables.

TITLE: Dependence of the degree of ambient flow of aerosol particles on the amplitude of the acoustic field at Reynolds numbers $0.5 \leq Re \leq 1$

SOURCE: Ref. zh. Fizika, Abs. 9Zh406

REF SOURCE: Tr. Leningr. in-t aviats. priborostr. vyp. 45, 1965, 60-63

TOPIC TAGS: aerosol, acoustic field, ambient flow, Reynolds number, aerosol particle, aerosol motion, nonlinear equation, vibration velocity

ABSTRACT: An analysis is made of the motion of aerosol particles in an acoustic field at Reynolds numbers $Re \leq 1$. An analytical correlation between the coefficient of ambient flow and the amplitude of the acoustic field is obtained from an approximate solution of a nonlinear equation for particle motion. An increase in the amplitude of the field was found to produce a decrease in the degree of streamline flow and the angle of shift in the phase of the vibration velocity of the particle relative to the medium.
